## 1. Introduction

According to the ICAO Assembly resolution A40-18, the Member States are invited to prepare and submit a State Action Plan to reduce international aviation emissions of CO<sub>2</sub> (carbon dioxide) greenhouse gases, including national actions, as well as activities implemented regionally or on a global scale as the result of bilateral and regional/multilateral agreements.

States should distinguish between domestic and international aviation. The impact of measures on domestic aviation may be considered a co-benefit of ICAO's global aspirational goals.

Emissions from ground support equipment operations and airport-related ground transportation are considered domestic emissions and are beyond the scope of Resolution A40-18. However, some States may wish to consider the aviation sector as a whole. In such cases, States may provide relevant additional information to help explain their strategies.

For action plans to fulfil their purpose in accordance with the provisions of Resolution A40-18, they should contain the following five elements:

1. *Contact information.* The focal point and any other person(s) responsible for the compilation and submission of the action plan
2. Baseline (without action) fuel consumption CO<sub>2</sub> emissions and traffic
3. *Measures to mitigate CO<sub>2</sub> emissions.* The measures being proposed to address CO<sub>2</sub> emissions from international aviation, distinguishing between those that are already in place and those that are being considered for future implementation, should be listed.
4. *Expected results* (fuel consumption, CO<sub>2</sub> emissions and traffic with the actions in #3 being taken). Similar to #2, in order for ICAO to understand the global effect of the actions being proposed by States, projected fuel consumption and traffic for the same future years provided in #2 that quantifies the effect of the actions listed in #3 should be submitted.
5. Assistance needs. A description of any specific needs (for example, financial, technological or capacity building) for the implementation of future actions should be described, if applicable.

**This document is an update of the previous State Action plan submitted in 2020.** The major changes since the last submission are the airlines fleet's composition and updates of their future equipage plans. These changes will reduce the CO<sub>2</sub> emission in the near future, nevertheless, due to the pandemic many planes have been frozen or delayed, some of the companies halted their equipping planes and some their efficiency measures.

## 2. Contact information

The focal point for the compilation and submission of the action plan are listed below:

|                       |                                    |

### 3. Airlines in Israel – International Flights

#### 3.1. El Al Israel Airlines Ltd.

El Al Israel Airlines Ltd. (El Al) is the largest international airline company with the largest fleet in Israel.

The Company operates international flights. Services include commercial flight services, charter flights and cargo. Further activities include the provision of catering services to its own and leased aircraft, such as at arrival and departure desks, cargo handling, security services and maintenance services for its own aircraft, as well as for other companies.

In the recent years El Al took out of service the old 737,747 fleets. El Al introducing the new 787-8,787-9. The new fleet composition includes efficient and economical new aircraft.

Future measures to reduce the CO2 emission and fuel burn are presented in par. 5.3

The current fleet is presented in table 1

*Table 1 – ELAL Fleet*

| Fleet            |            |        |
|------------------|------------|--------|
| Aircraft         | In Service | Orders |
| Boeing 737-800   | 16         | -      |
| Boeing 737-900ER | 8          | -      |
| Boeing 747-400   | 0          | -      |
| Boeing 777-200ER | 6          | -      |
| Boeing 787-8     | 3          | -      |
| Boeing 787-9     | 12         | -      |
| Boeing 747-400F  | 2          | -      |
| Total            | 47         | -      |

### 3.2. Arkia Israeli Airlines Ltd.

Arkia Israeli Airlines Ltd. operates as an international and domestic airline carrier in Israel. It offers charter flights, as well as scheduled flights, from Israel to various travel destinations in Europe; domestic flights in Israel; vacation packages; membership programs; and tourism and air travel services for business people.

The company's services also include aircraft maintenance, aircraft leasing to foreign airlines, aviation management, and consulting, as well as cargo shipping.

In the recent years Arkia took out of service the old 767, EMBRAER E190-100 from the fleets. Arkia has introduced the new Airbus 321neo. The new fleet composition includes efficient and economical new aircraft.

Future measures to reduce the CO2 emission and fuel burn are presented in par. 5.3

The current fleet is presented in table 2

*Table 2 – Arkia Fleet*

| Fleet            |            |        |
|------------------|------------|--------|
| Aircraft         | In Service | Orders |
| Airbus A321neo   | 2          | -      |
| Embraer ERJ-190  | 0          | -      |
| EMBRAER E190-200 | 3          | -      |
| Airbus A330neo   | 0          | -      |
| Boeing 757       | 0          | -      |
| Total            | 5          | -      |

### 3.3. ISRAIR Airlines & Tourism Ltd.

ISRAIR Airlines & Tourism Ltd. operates as an international and domestic airline carrier in Israel. It operates domestic flights to Eilat, and scheduled flights to overseas destinations in Israel and internationally. The company also provides cultural tourism services; offers vacation packages to events; and provides car rental services. In addition, it operates charter flights for wholesalers to a range of destinations in the Mediterranean (in Cyprus and Greece) and Europe. The company was founded in 1989 and is based in Tel Aviv, Israel.

In the recent years the company took out of service the B737-800 from the fleets. ISRAIR has introduced Airbus A320-200.

Future measures to reduce the CO2 emission and fuel burn are presented in par. 5.3

The current fleet is presented in table 3

*Table 3- ISRAIR fleet*

| Fleet       |            |        |
|-------------|------------|--------|
| Aircraft    | In Service | Orders |
| ATR-72      | 3          | -      |
| Airbus A320 | 5          | -      |
| Total       | 8          | -      |

### 3.4. CAL – Cargo Airlines Ltd.

CAL Cargo Airlines Ltd. is an all-cargo airline with its corporate headquarters in Airport City, Israel. The airline operates daily scheduled cargo flights and charter services carrying nonstandard goods and general cargo internationally. Its main base is Ben-Gurion Airport, serving Tel Aviv, and it has a hub at Liège Airport (Belgium). The airline carries all categories of nonstandard cargo: temperature controlled pharmaceutical and healthcare products, live animals, dangerous goods, oversize and overweight cargo, fresh perishable products and valuable goods

The carrier operates cargo services from its main hub at Ben-Gurion International Airport and its secondary hub at Liege Airport to the Netherlands (seasonal), United States and Cyprus.

Future measures to reduce the CO2 emission and fuel burn are presented in par. 5.3

The current fleet is presented in table 4

*Table 4- CAL Cargo fleet*

| Fleet             |            |        |
|-------------------|------------|--------|
| Aircraft          | In Service | Orders |
| Boeing 747-400ERF | 1          | -      |
| Boeing 747-400F   | 1          | -      |
| Total             | 2          | -      |

### 3.5. Aircraft withdrawn and introduced

The Israeli airline companies are renewing the fleets, introducing new generation aircraft including the Boeing 787, Airbus 321neo, and retiring the old generation aircraft. The new aircraft will dramatically reduce the fuel consumption and thereby reduce the amount of CO2 emission. The following table presents the number and type of aircraft that were withdrawn from service during the years 2019-21.

Table 5

| <b>Aircraft</b>  | <b>Withdrawn from use</b> | <b>Introduce to service</b> |
|------------------|---------------------------|-----------------------------|
| Boeing 747-400   | 4                         | -                           |
| Boeing 747-200F  | 2                         | -                           |
| Boeing 747-400F  | 3                         | 3                           |
| Boeing 767-300   | 3                         | -                           |
| Boeing 787-8     | 0                         | 3                           |
| Boeing 787-9     | -                         | 5                           |
| Airbus A321neo   | -                         | -                           |
| ATR 72           | 5                         |                             |
| EMBRAER E190-100 | 1                         | -                           |
| Boeing 737-800   | 2                         | -                           |
| <b>Total</b>     | <b>20</b>                 | <b>11</b>                   |

## 4. International airports in Israel

### 4.1. IAA- Israel Airports Authority

Ben-Gurion airport is taking actions to reduce the impact on the environment by promoting and implementing programs for energy management, reduction of emissions and noise levels, waste and recycling, and any other issue that has influence on the environment. One of the most challenging issues is global warming and climate change.

The main way in which companies face the challenge today is to reduce greenhouse gas emissions as a result of human activity.

Since 2010, IAA (Israel Airports Authority) is mapping the airport carbon footprint.

In 2015 IAA joined the international ACA program - Airport Carbon Accreditation, managing and mapping the carbon emissions.

In 2016, the field was certified to level 2 according to the plan - emissions management. In this framework, a comprehensive plan was drawn up to manage and reduce greenhouse gas emissions in the field, including detailing the measures and setting targets for reduction. The plan also includes details of an organizational framework that supports its implementation, a strategy for implementing projects to reduce emissions, training employees and increasing the awareness of stakeholders (employees, suppliers and franchisees, and the traveling public), as well as conducting periodic inspections and controls following the pace of the plan's implementation. This document presents the updates to the emissions management plan, including setting updated goals for reducing emissions until 2025 and planned projects to achieve this goal.

#### **The organizational framework for emissions management**

The policy of the Authority for the Management of Greenhouse Gas Emissions is included in the framework of the general environmental policy. The policy was updated in 2020 and approved by the management as part of the annual management survey conducted in April 2021. The environmental policy of the authority is published on the authority's website.

As part of the preparations for the implementation of the carbon footprint management plan, a dedicated steering committee is operating consisting of the relevant officials in the various units. The main areas of activity of the committee include:

- The formulation of the strategic vision in the field of greenhouse gas emissions
- Determining and approving targets for saving and reducing emissions

- Preparing and approving a work plan to implement energy saving measures and methods
- Monitoring and controlling the progress (including monitoring and measuring the achieved savings)
- Identifying and removing barriers to implementing the program

#### Emission reduction targets

The emissions management plan from 2016 presented a goal of reducing emissions by 10% in average emissions per passenger in 2020, compared to 2016, to a level of 4.23 kg CO<sub>2</sub>e per passenger. In practice, this goal was already achieved in 2017. In 2019, the average level of emissions per passenger in the field was 3.02 kg CO<sub>2</sub>e per passenger - a decrease of about 35% compared to the base year. During this period, there was an increase of approximately 38% in the number of annual passengers at the airport, to approximately 24.8 million passengers, while the volume of greenhouse gas emissions decreased by approximately 11% in absolute terms.

The calculation of the reduction target for 2025 refers to the data of 2019 as the base year. Due to the decisive impact of the corona epidemic on the activity of the global aviation industry and on the aviation industry in particular, the volumes of emissions in 2020-21 are not representative and it was preferred to refer to the full year of activity in a normal activity format as a basis for reference.

The updated emissions target is 2.56 kg of CO<sub>2</sub>e per passenger - a reduction of approximately 15% compared to the base year 2019. The target is based on an expectation that the scope of activity in the field in the target year will be approximately 24.5 million passengers, in light of the expected recovery of the aviation industry with the decline of the Corona effect on the industry.

#### IAA - Activities for emission reduction

*Table 6*

| <u>Activity</u>                                   | <u>Estimated CO<sub>2</sub> reduction (tons)</u> |
|---|--|
| <u>Electric generation by natural gas</u>         | 3,272  |
| <u>Using combined cycle generator</u>             | 1,665.5  |
| <u>Improvements in the air conditioning units</u> | 6,928.20   |
| <u>Replacing light fixtures and bulbs</u>         | 326.8  |
| <b>Total</b>                                      | <b>12,192.3</b>                                  |

Average emissions per passenger and aircraft 2019-2025

Table 7

|                        | 2019       | 2025 without mitigation of action measures | 2025 with mitigation of action measures | Rate of change |
|------------------------|------------|--|---|----------------|
| Passengers             | 24,821,600 | 24,500,000                                 | 24,500,000                              | -1.3%          |
| Total CO2              | 74,924     | 74,924                                     | 62,730                                  | -16.3%         |
| Emission per passenger | 3.02       | 3.06                                       | 2.56                                    | -15%           |

(Source - IAA TLV carbon management plan may 2022)

## 5. Baseline for future CO2 aviation emissions

### 5.1. Historical data

The RTK and fuel burn from 2010-2021 were used as the baseline for forecasting fuel consumption. The data is collected and submitted by the airlines to CAAI.

Table 8

| Year | International RTK | International Fuel Burn | Fuel efficiency |
|------|-------------------|-------------------------|-----------------|
| 2010 | 2,653,203         | 724,072                 | 0.273           |
| 2011 | 2,651,207         | 711,851                 | 0.269           |
| 2012 | 2,598,901         | 662,461                 | 0.255           |
| 2013 | 2,658,276         | 681,920                 | 0.257           |
| 2014 | 2,592,826         | 695,891                 | 0.268           |
| 2015 | 2,763,616         | 722,656                 | 0.261           |
| 2016 | 3,222,640         | 861,715                 | 0.267           |
| 2017 | 3,454,833         | 899,653                 | 0.260           |
| 2018 | 3,565,408         | 901,043                 | 0.253           |
| 2019 | 3,581,421         | 868,496                 | 0.243           |
| 2020 | 1,298,809         | 268,705                 | 0.207           |
| 2021 | 1,799,070         | 405,858                 | 0.226           |

### 5.2. Reference baseline – without correcting measures

The historical data is the basis for calculating the expected RTK and fuel burn baseline. Considering the future traffic growth of the Israeli airlines, without corrective measures to reduce emissions.

Table 9

| <b>BASELINE</b> |                                     |   |   |
|-----------------|-------------------------------------|---|---|
| <b>Year</b>     | <b>International RTK<br/>(‘000)</b> | <b>International Fuel burn<br/>(Tonnes)</b> | <b>Efficiency<br/>(Fuel burn / RTK)</b> |
| 2019            | 3,300,210.00                        | 868,943.00                                  | 0.263                                   |
| 2020            | 3,412,417.14                        | 894,101.93                                  | 0.262                                   |
| 2021            | 3,528,439.32                        | 923,771.62                                  | 0.262                                   |

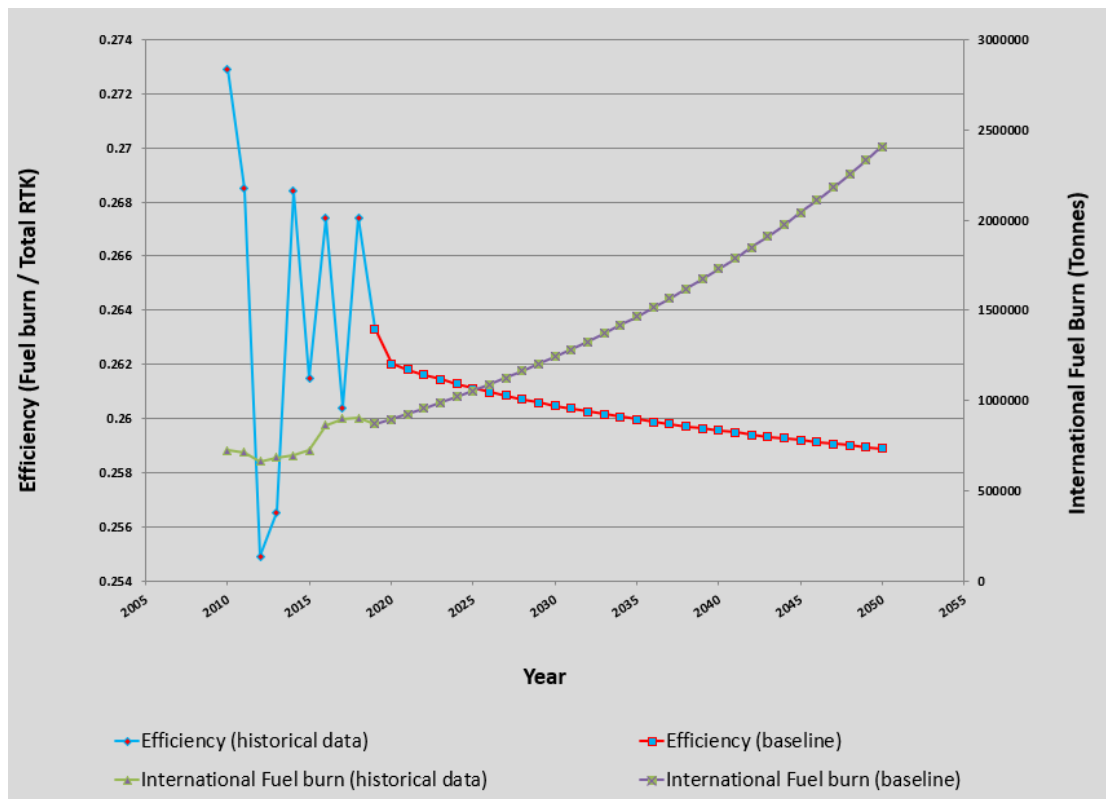

Figure 1

### 5.3. Basket of Measures to Reduce CO2 Emissions

One of the major changes that will influence dramatically the fuel consumption are the airline's fleet composition, specifically introducing new generation aircraft to replace the old types of aircraft. The new fuel-efficient aircraft – Boeing 787, airbus 321neo are entering into service and will reduce the fuel consumption.

Other measures of improved air traffic management and infrastructure use, more efficient operation and maintenance will contribute to reduction in fuel consumption and therefore reduce emissions.

The following ongoing and future measures are used to calculate and estimate the CO2 emission. The categories of the measures are:

- a) aircraft-related technology;
- b) improved air traffic management and infrastructure use;
- c) more efficient operations;
- d) Airport improvements/other.

Table 10

| Measure Description   | Implementation year |
|---|---------------------|
| <b>Aircraft-related technology development - purchase of new aircraft</b> |                     |
| ELAL - Boeing 787-8 – 2 airplanes   | 2019                |
| ELAL - Boeing 787-9 – 12 airplanes  | 2017-2020           |
| Arkia -Airbus 321neo – 3 airplanes  | 2018-2020           |
|   |                     |
| <b>improve ground operations</b>  |                     |
| Israir - Reduce use of APU  | 2016-2021           |
| ELAL - Reduce use of APU  | 2014-2021           |
|   |                     |
| <b>improve the use of optimum flight levels</b>                           |                     |
| ELAL - Increase flight level during cruise in B737                        | 2014-               |
|   |                     |
| <b>improve the use of optimum routings</b>                                |                     |
| ELAL - Using cost index software  | 2015-               |
| Arkia - Using Cost Index software   | 2017-               |
| Israir - Using Cost Index software  | 2015-               |
| C.A.L. - Using Cost Index software  | 2007-               |
|   |                     |
| <b>More efficient operations</b>  |                     |
| <b>minimizing weight</b>  |                     |
| ELAL - reducing water amount  | 2016-               |
| ELAL - removing redundant items   | 2019-               |
| ELAL - Reduction in superfluous route reserve                             | 2016                |
| Israir – Reducing water amount  | TBD                 |
| Israir - replacing aircraft seats   | 2020                |
| Israir - Removing redundant items   | TBD                 |
| C.A.L - reducing water amount, removing redundant / unnecessary items     | 2007-               |
|   |                     |
| <b>minimizing flaps (take-off and landing)</b>                            |                     |
| ELAL - Lowering acceleration altitude and flaps retracting altitude       | 2014-               |
|   |                     |
| <b>minimizing reversers use</b>   |                     |
| Israir - switch to idle position in thrust reversers                      | 2018-               |
|   |                     |
| <b>single engine taxi</b>   |                     |
| ELAL - In taxiing (turn off one engine) after landing,                    | 2014-               |

| Measure Description   |         |
|---|---------|
| Israil - In taxiing (turn off engine) after landing   | 2012-   |
| Arkia - In taxiing (turn off engine) after landing  | 2016-   |
|   |         |
| <b>loading</b>  |         |
| ELAL - Flight balance - loading – AFT CG  | 2014-   |
| Israil - Flight balance – AFT CG loading  | 2012-   |
| ARKIA - Flight balance – AFT CG loading   | 2018-   |
|   |         |
|   |         |
| <b>reduced speed</b>  |         |
| Arkia - reduced power for take-off and climb.<br>Continuous climb and decent                                      | 2018-   |
| Israil - Use of FMGS managed speed  | 2012-   |
|   |         |
| <b>optimized aircraft maintenance</b>   |         |
| ELAL - Engine wash  | 2014-   |
| Arkia - Engine wash   | 2019-   |
| Arkia - aircraft external wash  | 2019-   |
| Israil – aircraft external wash   | 2017-   |
| C.A.L. - aircraft external cleaning   | 2007-   |
|   |         |
| <b>Other</b>  |         |
| ELAL - extending landing gear at lower altitude   | 2015-   |
| Arkia - extending landing gear at lower altitude  | TBD     |
| ELAL - Location of alternate airports closer to the destination<br>and obtaining CAAI's approval                  | ongoing |
| ELAL - Dispatching to airports that have no alternate airport in<br>good weather implementation of RNP approaches | ongoing |
| Israil - Weather procedure to allow dispatch to alternate airport   | ongoing |
| Israil - extending landing gear at lower altitude   | TBD     |
|   |         |
| <b>Airport improvements</b>   |         |
| Changes in Operational procedures in Ben-Gurion airport as a<br>result of runways system upgrade.                 | 2015-   |
| Changes in Operational procedures using PBN approach<br>procedures  | TBD     |
| Reducing the use of APU in Ben-Gurion airport   | Ongoing |
| Ben-Gurion airport Carbon footprint Accreditation   | Ongoing |
| Green Building in Ben-Gurion airport  | Ongoing |

*Note: the reported measures are based on airline reports and future activities plans.*

#### **5.4. Expected results – including correcting measures**

The ICAO's Environmental Benefit Tool was used to calculate the future emission and expected results, based on historical data and measures to reduce emissions. The EBT incorporate fuel saving calculations for each type of aircraft (narrow body, wide body, turboprop etc.) and each type of measure (aircraft technology, more efficient operations, improved air traffic management and infrastructure use etc.).

The following results were achieved.

Table 11

| EXPECTED RESULTS : CO <sub>2</sub> SAVINGS |   |  |   |                                    |
|--|---|--|---|------------------------------------|
| Year                                       | Annual CO <sub>2</sub> emissions before implementation of mitigation actions (Tonnes) | Annual CO <sub>2</sub> emissions after implementation of mitigation actions (Tonnes) | Annual CO <sub>2</sub> savings (Tonnes) | Change CO <sub>2</sub> savings (%) |
| 2019                                       | 2,745,859.88  | 2,321,967.12   | 423,892.76                              | -15.44                             |
| 2020                                       | 2,825,362.10  | 2,358,421.98   | 466,940.11                              | -16.53                             |
| 2021                                       | 2,919,118.32  | 2,452,178.21   | 466,940.11                              | -16.00                             |
| 2022                                       | 3,016,174.82  | 2,549,234.71   | 466,940.11                              | -15.48                             |

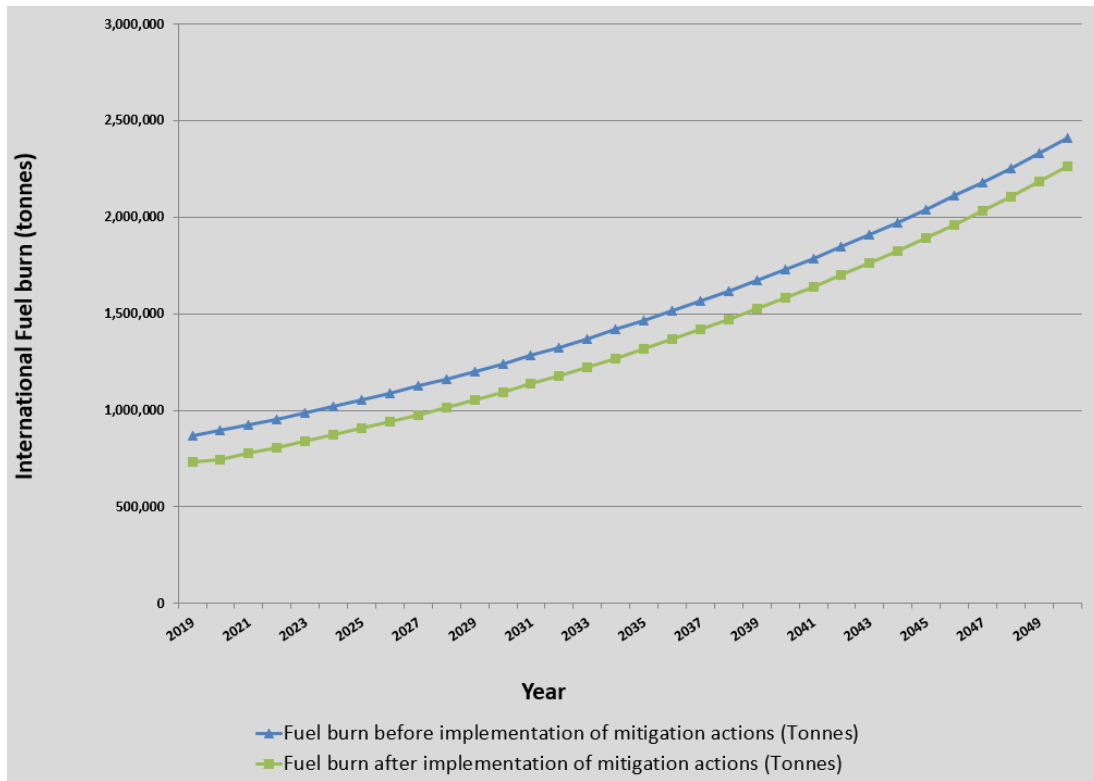

Figure 2 – expected fuel consumption

## 6. Summary and Conclusions

CAAI has mapped the currently known measures that could lead to fuel saving and reduction of CO<sub>2</sub> emissions, as well as estimated future emission reduction. Mapping and estimation of expected reduction of emissions had been carried out with the assistance of stakeholders in Israel's aviation industry

Israel's Action Plan update reviews activities already implemented by the airlines and IAA (Appendix A) as well as activities planned in the future for greenhouse gas (CO<sub>2</sub>) emissions reduction from Israel's civil aviation sector.

The state action plan update incorporates the updated airline fleet composition, introducing new generation aircrafts and removing from service old aircrafts. Also, the influence of the open sky's agreement is reflected in the historic data that was used to establish the updated baseline.

The pandemic had a massive impact on the RTK as demonstrated in the historical data Table 8 for 2020-2021, the actual RTK for year 2020 is 60% lower than the expected RTK for that year.

Implementation of previous measures (Appendix A) to reduce fuel consumption are reflected in the actual fuel burn efficiency for years 2015-2021.

Table 12 reflects an actual improvement of more than 2% fuel burn efficiency when measures to reduce fuel consumption are implemented, thereby justifying the plan and its past and future implementation.

The future implementation of measures to reduce fuel consumption are expected to continuously improve CO<sub>2</sub> emission efficiency by an average of more than 1.5 per cent per annum.

The CAAI future activities:

- Continuous overseeing and monitoring of statistical reports submitted by the air carriers in regard of fuel consumption and RTK, in order to improve data reliability.
- Ongoing monitoring, with the assistance of Israel's Aviation industry stakeholders, of the implementation of measures already included in the current plan, and developments concerning emissions reduction.
- Examine new measures and technologies that can reduce greenhouse emissions in the future.

## Appendix A

Status of previous state action plan activities and measures of Airlines.

### 1. EL-AL

| Action description                      | details  | status          |
|---|--|-----------------|
| fleet renewal program                   | Purchase of Boeing 737-900 airplanes.  | Completed       |
|   | Removal of Boeing 737-700 planes   | Completed       |
| Retrofit                                | Retrofit wingtip   | Completed       |
| Reduction of Aircraft Weight            | Removing rear fuel tank – B747   | Not implemented |
|   | Reducing the amount of water for kitchens and bathrooms.   | implemented     |
|   | Removing redundant items from Fly Away Kit in B737 and B747-400 aircraft.  | implemented     |
| <b>Flight techniques and procedures</b> |  |                 |
|   | Fuel saving during taxiing before take-off – starting last engine only before take-off                                       | Not implemented |
|   | Fuel saving during taxiing after landing – turn off one engine after landing   | implemented     |
|   | Lowering acceleration altitude and flaps retracting altitude from 1500 feet to 1000 feet (in airports that allow it).        | implemented     |
|   | Extending landing gear before landing in lower altitude, from 2500 feet to 2000 feet   | implemented     |
|   | Weight and balance in flight - training of load controllers and emphasizing the importance of rear center of gravity loading | implemented     |
|   | Reducing fuel amount in dispatching  | implemented     |
|   | Reduction in superfluous Route Reserve Fuel  | implemented     |

|                    |  |                    |
|--------------------|--|--------------------|
|                    | Using Cost Index (Route planning optimization software)  | implemented        |
|                    | Increasing flight level  | implemented        |
|                    | Dispatching to European airports that have no alternate airport (in good weather conditions) - real-time weather monitoring system, NO-TAM and standby in destination. | Partly implemented |
|                    | Ongoing location of alternate airports closer to the destination and obtaining CAAI's approval.  | Partly implemented |
|                    | Training and approval to perform RNP approaches.   |                    |
| <b>Maintenance</b> |  |                    |
|                    | Increasing the frequency of engines wash   | implemented        |
|                    | Reduction of APU utilization   | implemented        |

## 2. ARKIA

| Action description                                  | details  | status             |
|---|--|--------------------|
| fleet renewal program                               | Purchase of four (4) Airbus 321neo   | Partly implemented |
|   | removal of Boeing 757-300 planes   | Partly implemented |
| Winglets Retrofit                                   | Retrofit wingtip with Blended Winglets B757-300 airplanes  | implemented        |
| Best practice methods in flight operations in Arkia | Using Cost Index (optimization of flight routes planning, performance and flight profile according to cost data)           | implemented        |
| External wash of aircraft and engines in Arkia      | Increase washes frequency <ul style="list-style-type: none"> <li>- Engine wash</li> <li>- External wash reduces</li> </ul> | Partly implemented |

## 3. ISARAIR

| Action description                  | details  | status                                  |
|-------------------------------------|--|---|
| Flight techniques and               | Loading cargo to achieve optimal center of gravity   | implemented                             |
|                                     | After landing, switch to idle position (instead of full position) in thrust reversers.   | implemented                             |
|                                     | Turn off one engine after landing  | Partly implemented                      |
|                                     | Reducing APU usage on the ground   | Not implemented                         |
|                                     | Optional techniques under examination:<br>Lowering acceleration altitude from 1500 feet to 800 feet and reduced climb thrust   | Not implemented                         |
|                                     | Single engine taxi to take-off runway  | Not implemented                         |
| Retrofit                            | Airbus shark lets for A320 aircraft,   | Not implemented                         |
| Reducing fuel amount in dispatching | Managed planning and dispatching concept, and using Cost Index (Using FWZ software for route planning optimization) - resulting in slower flight and fuel consumption saving.  | implemented                             |
|                                     | Operations - maximum use of FMGS managed speed. Exists and implemented in the fleet's procedures.  | implemented                             |
|                                     | Update dispatching weather procedure to allow direct dispatch to alternate airport and eliminating the need to dispatch to airport expected to be closed. Implementation is scheduled for early 2015 with the introduction of new regulations. | implemented                             |
|                                     | Early acceleration during climb, if possible in terms of airspace traffic, and subject to air traffic control approval .Since most often it is not authorized by air traffic control, this procedure is not implemented in practice.           | Not implemented – airspace restrictions |
| Reduction of aircraft weight        | Partial filling of the water tank in accordance with planned   | Not implemented                         |
|                                     | Reducing additional equipment (Fly Away Kit) on the aircraft to the minimum required   | Not implemented                         |
|                                     | Flight Guard protection system - added weight of 01 kg. Total system weight after installation will be approximately 401kg, which is expected to increase overall fuel consumption by 1%.  | Implemented on all aircrafts            |

|             |  |  |
|-------------|--|--|
|             | Reducing the amount of spare fuel taken by the crews     | implemented                              |
|             | Activation of Electronic Flight Bag (EFB) in the cockpit | implemented                              |
| Maintenance | Increasing frequency of aircraft's wash cycles:          | Implemented with improved cleaning agent |

#### 4. C.A.L Cargo airlines

| Action description                              | details  | status      |
|---|--|-------------|
| C.A.L. fleet renewal program                    | C.A.L. fleet renewal program:<br>Procurement of Boeing 747-400 cargo aircraft and removal of Boeing 747-200 aircraft<br>By 2015 the company's fleet will include 2 Boeing 747-400 airplanes, replacing Boeing 747-200.<br>The new aircraft are about 15% more efficient in fuel consumption than the previous model. | completed   |
| Installation of New flight management computers | Insulation of a New generation FMC flight management computers   | completed   |
| Fuel savings plan - operating procedures        | Reducing excess weight   | implemented |
|   | Limiting water tank  | implemented |
|   | Periodically removing redundant items from the aircraft  | implemented |
|   | Removing unnecessary items from Fly Away Kit   | implemented |
|   | Using Cost Index (Route planning optimization software)  | implemented |
|   | Improvement of fuel consumption in cruise  | implemented |
|   | Aerodynamic external cleaning of the aircraft  | implemented |
|   | Minimizing use of APU (Auxiliary Power Unit) by using gerund air-condition   | implemented |
|   | Reducing access route reserve (beyond law requirements)  | implemented |
|   | Using wind updates in brave time broadcast to the plane  | implemented |
| Shorten flight time to china by using route 888 | implemented  |             |
